

Treated municipal biosolids contain nutrients and organics that aren't available in commercial fertilizers. When we apply these organics to land, they replenish soil, combat erosion and support plant growth.

Biosolids Land Application

As the largest biosolids supplier in Ontario, Terrapure Organics Solutions has the resources to create and manage your custom, compliant organics program that adjusts to your crop-rotation plan.

Our organics and nutrients are a cost-effective way to improve yields and, by extension, your bottom line.

Before application, one of our NASM-certified personnel tests your soil and prepares a fertilizer program based on the results, so you get biosolids that give your soil and crop exactly what they need. Every program we create meets all regulations, taking the guesswork out of compliance. When we apply organics to your fields, we make all the arrangements, and provide you with a comprehensive post-application report.

Services Offered Include

- Turnkey application
 - Soil and organics testing
 - Custom organics program
 - Land application
 - Reporting

Industries We Serve

- Agriculture
- Forestry
- Mining (land reclamation)
- Construction (brownfield reclamation)

Recovering Value

- For land reclamation applications, using treated biosolids instead of native materials isn't just more sustainable; it also saves the costs associated with extracting virgin aggregates.

Did You Know?

- There are strict requirements for testing municipal biosolids to ensure metals and pathogens are below the maximum safe levels established by the scientific community and regulated by the government. Our experts work with the regulator to ensure we comply with current standards, and to develop new standards that make sense for evolving industries and applications.
